

# South African Experience on In situ Recycling with Bitumen Emulsion and Foamed Bitumen

By Elzbieta Sadzik

Gauteng Department of Public Transport, Roads & Works

## Contents

- ◆ Introduction
- ◆ Issues related to design
- ◆ Issues related to construction
- ◆ Political and social issues
- ◆ Conclusions

## Introduction

- ◆ South African road network
- ◆ Environmental legislature
- ◆ Arrival of high speed recyclers
- ◆ Foamed bitumen = emulsion ?

## Issues related to design

- ◆ Lack of lab. mixers simulating field conditions

## Issues related to design

### ◆ Optimum bitumen and active filler ratio

### ◆ Appropriate performance tests

Material Code		ITS (kPa)	
		100-300	300-500
UCS (kPa)	700 - 1400	FB4	FB3
	1400-2000	FB2	FB1

## Issues related to design

- ◆ Pre-design pavement investigation
- ◆ Sampling of material

## Issues related to design

### ◆ Comparison between emulsion and foamed bitumen treated layers

Proffered conditions for use of foamed bitumen :

- Early opening to traffic
- High initial moisture content

Proffered conditions for use of emulsion :

- Inadequate foaming properties
- Material temperature < 15°C
- Inadequate fines in the material (< 5%)

## Issues related to design

### ◆ Mechanistic-empirical design method

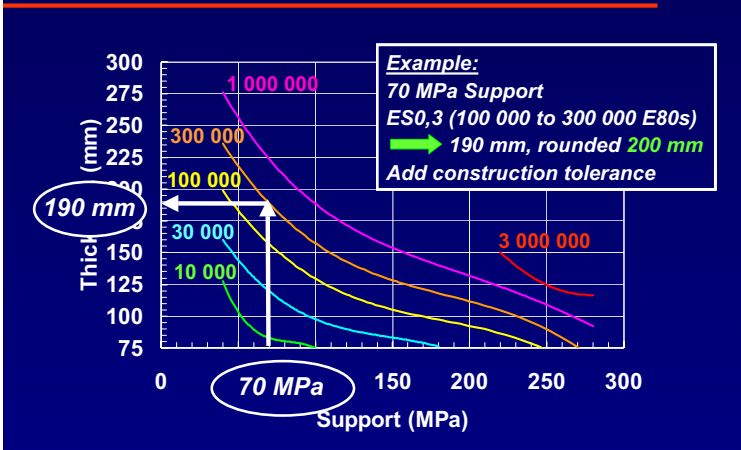

Distress mechanisms:

- Effective fatigue
- Permanent deformation

Development of transfer functions

## Deep in situ recycling, design charts

## Issues related to construction

### ◆ Differences between conventional and high speed recycling

- Cross or forward blend of material
- Application of cement
- Limited time for corrections

## Issues related to construction: compaction

## Issues related to construction

- ◆ Construction in temp. < 15°C
  - Influence of aggregate temp. on particle coating
  - Foam suitability

Foam Index (sec)	Aggregate 15°C	Aggregate 25°C
<75	Unsuitable	Unsuitable
75 – 100	Very poor	Poor
100 – 125	Poor	Moderate
125 – 175	Moderate	Good
175 – 200	Good	Very good
>200	Very good	Very good

## Political and social issues

- ◆ Labour intensive construction (LIC)
- ◆ Development of small, micro and medium entrepreneurs

## Political and social issues

### In-plant mixing

- ◆ New / upgrading projects
- ◆ Control of input materials
- ◆ Quality of mixing
- ◆ Stockpiling

## Labour-intensive construction

## Labour Intensive Construction

- ◆ Quality of road surface finish
- ◆ Compaction
- ◆ Quality control
- ◆ Construction duration

## Political and social issues

- ◆ LIC construction cost
- ◆ Social benefits of LIC

## Recycling with Foamed Bitumen and Emulsion

### Conclusions

- ◆ In place deep recycling and in plant recycling were successfully used in South Africa
- ◆ This technology can also be used for labour intensive construction
- ◆ Effective when carefully controlled

## SA Experience on Recycling with Foamed Bitumen and Emulsion

- ◆ Interim Technical Guidelines:  
The Design and Use of Foamed Bitumen Treated Materials
